

Lift Technologies Integral Sideshifter (ISS) – Attachment Usage

The integral sideshifter front frame is designed to minimize lost load while using standard ITA forks. Attachments are approved for use on the ISS under the following conditions:

Non-rotating attachments with sideshift are approved only when Lift Technologies lock out kit (part # 252662) is installed on the ISS disabling the integral sideshift operation.

Non-rotating attachments without sideshift are approved.

Attachments that rotate are not to be used on the ISS because the rotation of the load and subsequent load paths through the ISS could cause high off center loading of the front frame and cause permanent deformation of components which have been loaded beyond their designed limits.

Upon request to Lift Technologies engineering, specific attachments will be considered for use, but must first be reviewed and approved.
